

HOW DOES

# REVTECS PROTECTION WORKS

The surface of the glass is far from even when looked at with a microscope. It shows mountains all over. This is why many other matters will stick on it (dust, dirt, grease, insects, ice...) and be hard to clean off. The nano-liquid will penetrate this porosity and finish the covering with an absolutely slick layer.

REVTECS **PROTECTION**

0.0004 mm

The surface of the glass is far from being slick,  
As we may think...

When you look at glass under a microscope it seems you look at a mountain range. Revtecs Protection will level off and flatten those mountains.
